Preface

Company Profile

Founded in 2014, Shenzhen Lonten Technology Co., Ltd. focuses on the design, research production of Electronics Module for robotics related products. Consisting of professional researchers and skilled engineers, our R&D team constantly strives for creative function and excellent user experience. The company's R&D investments on arduino kits raspberry pi kits, as well as 3D printer and robots that back up STEAM education.

Customer Service

Our self-owned factory is certificated with BSCI and SO, covering an area of 5,000 square meters, and achieving an annual production capacity of over 10,000 units. Our products are all certified to CE, FCC, and ROHS standards, have exported to more than 100 countries including, but not limited to France, the United States of America, Australia, Russia, the United Kingdom, Germany, Singapore, Egypt, and India, bringing technological innovation to all walks of life.

Tutorial

This tutorial include codes, libraries and detailed user documentation. It is designed for beginners. You will learn all the basic knowledge about how to use Arduino controller board, sensors and components.

How to Install Arduino IDE

Introduction

The Arduino Integrated Development Environment (IDE) is the software side of the Arduino platform.

In this Project, you will learn how to setup your computer to use Arduino and how to set about the Projects that follow.

The Arduino software that you will use to program your Arduino is available for Windows, Mac and Linux. The installation process is different for all three platforms and unfortunately there is a certain amount of manual work to install the software.

STEP 1: Go to <https://www.arduino.cc/en/software>.

The screenshot shows the Arduino IDE 2.1.1 download page. On the left, there is a section for Arduino IDE 2.1.1 with a description of its features and a link to the documentation. On the right, there is a section for download options for Windows, Linux, and macOS, including links to the source code and release notes.

Arduino IDE 2.1.1

The new major release of the Arduino IDE is faster and even more powerful! In addition to a more modern editor and a more responsive interface it features autocompletion, code navigation, and even a live debugger.

For more details, please refer to the [Arduino IDE 2.0 documentation](#).

Nightly builds with the latest bugfixes are available through the section below.

SOURCE CODE

The Arduino IDE 2.0 is open source and its source code is hosted on [GitHub](#).

DOWNLOAD OPTIONS

Windows Win 10 and newer, 64 bits
Windows MSI installer
Windows ZIP file

Linux Appliance 64 bits (X86-64)
Linux ZIP file 64 bits (X86-64)

macOS Intel, 10.14: "Mojave" or newer, 64 bits
macOS Apple Silicon, 11: "Big Sur" or newer, 64 bits

[Release Notes](#)

The version available at this website is usually the latest version, and the actual version may be newer than the version in the picture.

STEP2: Download the development software that is compatible with the operating.

system of your computer. Take Windows as an example here.

Click Windows Win 10 and newer,64 bits.

Click JUST DOWNLOAD.

Also version 2.1.1 is available in the material we provided, and the versions of our materials are the latest versions when this course was made.

-  arduino-ide_2.1.1_Linux_64bit
-  arduino-ide_2.1.1_macOS_64bit
-  arduino-ide_2.1.1_Windows_64bit
-  arduino-ide_2.1.1_Windows_64bit

Installing Arduino (Windows)

Install Arduino with the exe. Installation package.

 arduino-ide_2.1.1_Windows_64bit

Click I Agree to see the following interface.

LROBRUYA

Click Next

You can press Browse... to choose an installation path or directly type in the directory you want.

LROBRUYA

Click Install to initiate installation

Finally, the following interface appears, click Install to finish the installation.

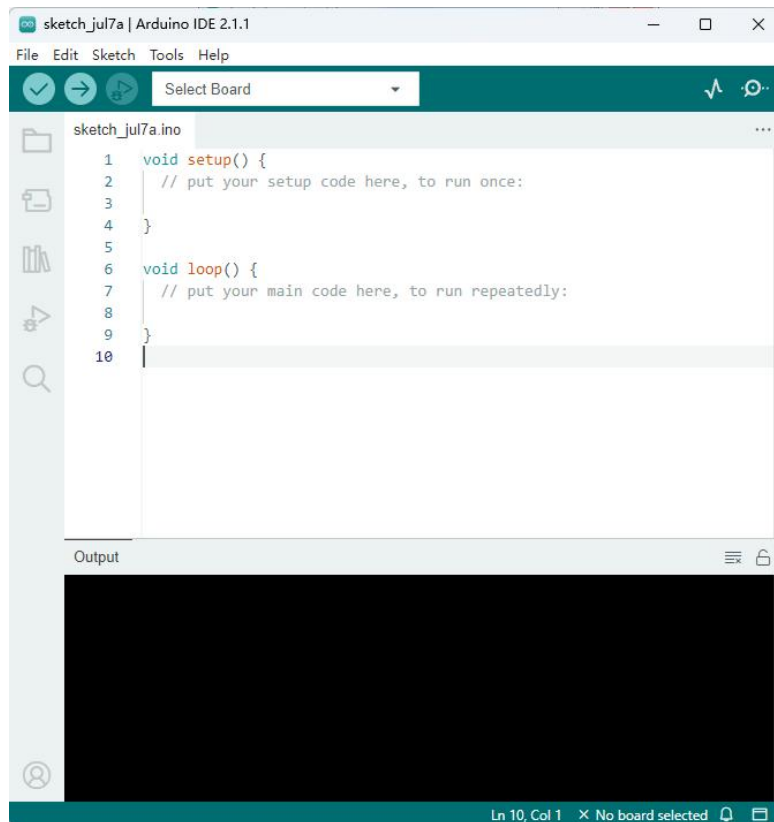

LROBRUYA

Next, the following icon appears on the desktop

Double-click to enter the desired development environment

You may directly choose the installation package for installation and

skip the contents below and jump to the next section. But if you want to learn some methods other than the installation package, please continue to read the section.

Unzip the zip file downloaded, Double-click to open the program and enter the desired development environment.

arduino-ide_2.1.1_Windows_64bit

LROBRUYA

How to Install Arduino Driver

For Windows

Arduino UNO(serial conversion chip is CH340G)

The USB to serial port chip of this control board is CH340G. So you need to install the driver for the chip. You can click the driver file [here](#).

In different systems, the driver installation is similar. Here we start to install the driver on the Win10 system. You can find the “USB_Drive_CH341_3_1” folder in the information we provide, this is the driver file we want to install.

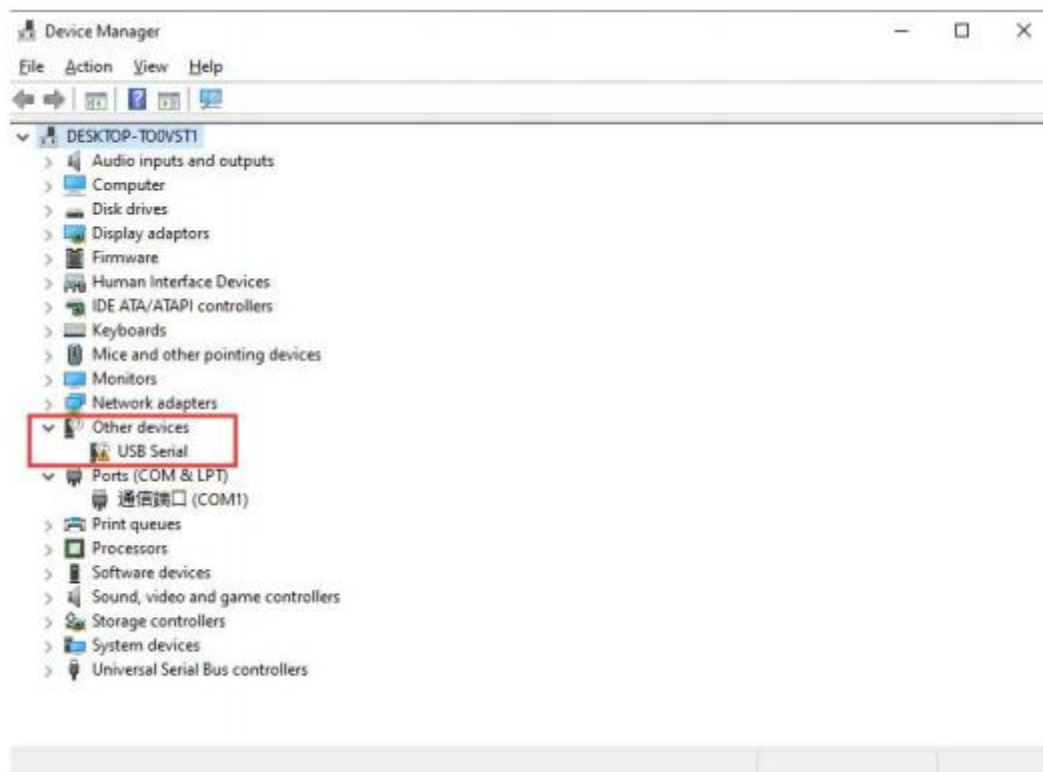

LROBRUYA

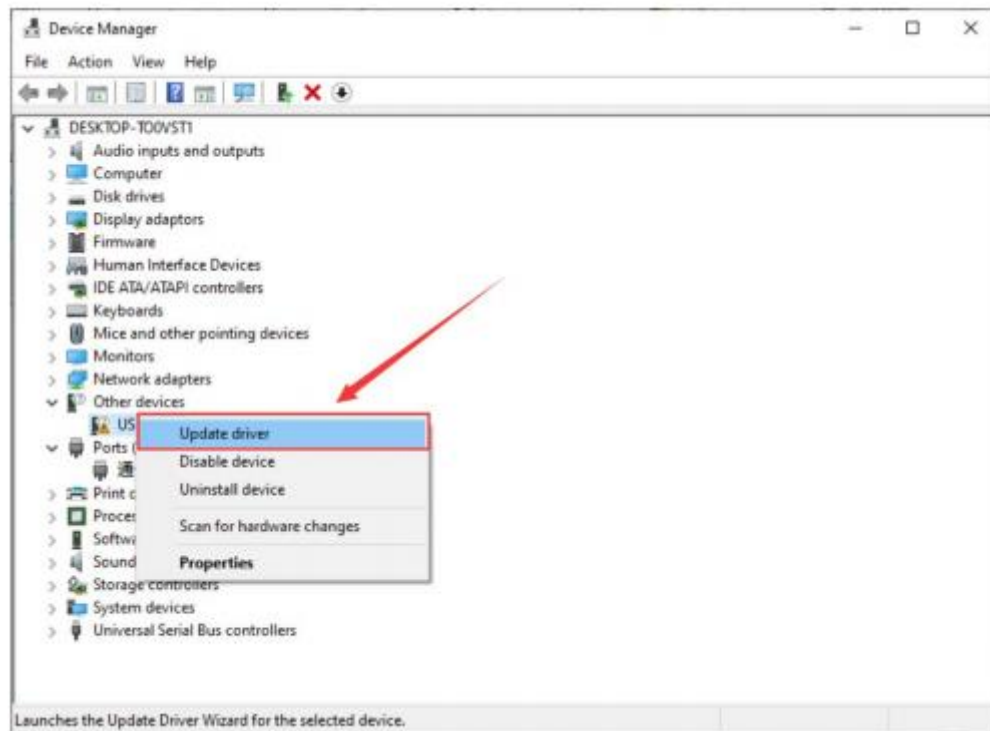

USB_Drive
_CH341_3_
1_For_Win
dows

Plug one end of your USB cable into the Arduino UNO CH340 Board and the other into a USB socket on your computer.

When you connect the Arduino UNO CH340 Board to your computer at the first time, right click your “My Computer”—>for “Properties”—>click the “Device manager”, under Other devices, you should see the “USB-Serial” or “Unknown device”. Or you can search for "devi" in your computer, or you can open the device manager of your computer.

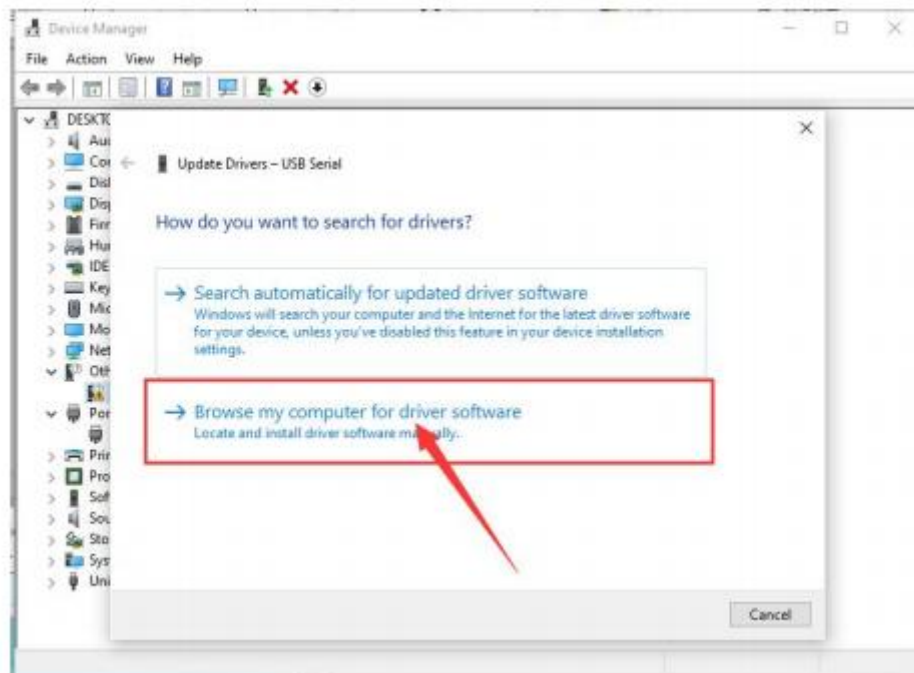

Then right-click on the device and select the top menu option (Update Driver Software...) shown as the figure below.

Then it will be prompted to either “Search Automatically for updated driver software” or “Browse my computer for driver software”. Shown as below. In this page, select “Browse my computer for driver software”.

LROBRUYA

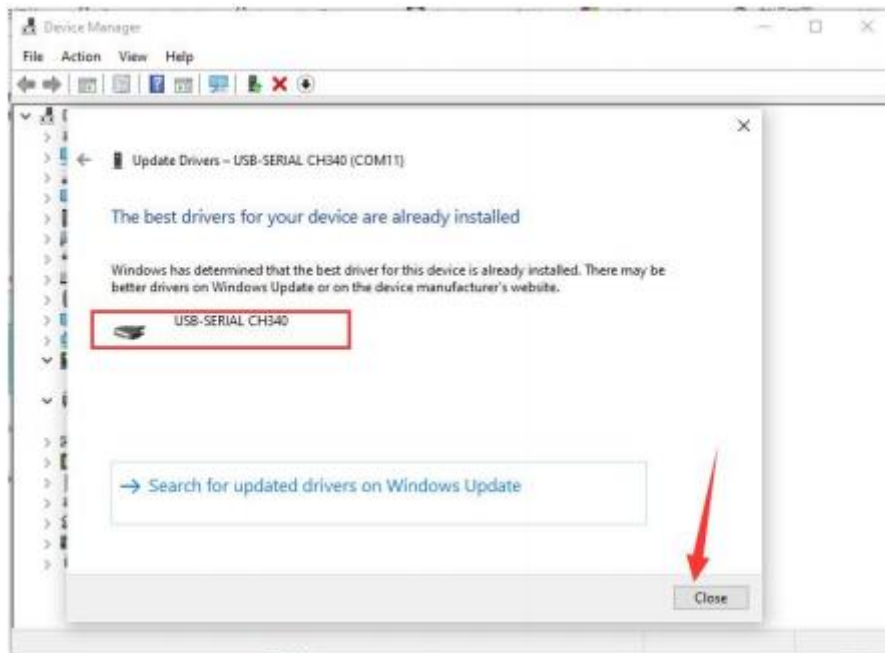

After that, select the browse option and navigate to the drive folder "USB_Drive_CH341_3_1", which can be found in the information we provide. (Note that the file path selects the location of the .For example, I store this driver file on the computer desktop, so the file path I choose is `C:\Users\mayn\Desktop\USB_Drive_CH341_3_1_For_Windows`)

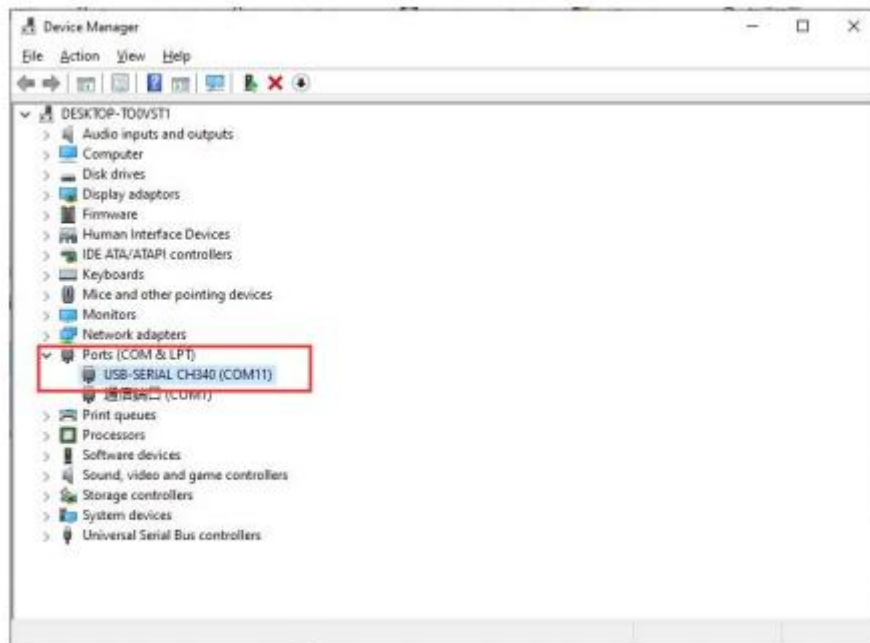

Once the software has been installed, you will get a confirmation message.

Installation completed, click “Close”.

Up to now, the driver is installed well. Then you can right click “My Computer”—>for “Properties”—>click the “Device manager”, you should see the device as the figure shown below. Or you can search for "devi" in your computer, or you can open the device manager of your computer.

LROBRUYA

For MAC System

Arduino UNO(serial conversion chip is CH340G)

Plug one end of your USB cable into the Arduino UNO CH340 Board and the other into a USB socket on your computer.

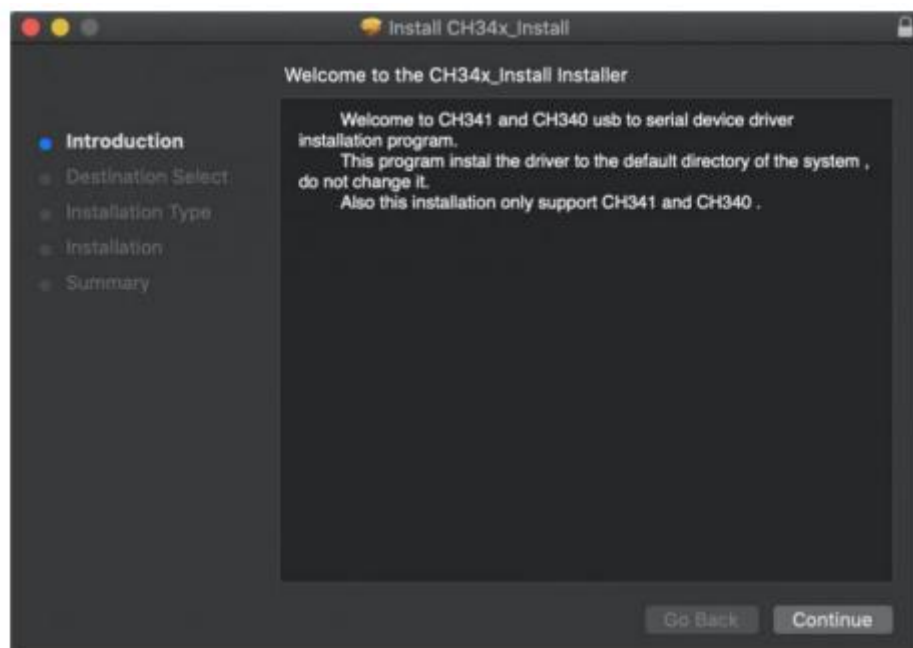

LROBRUYA

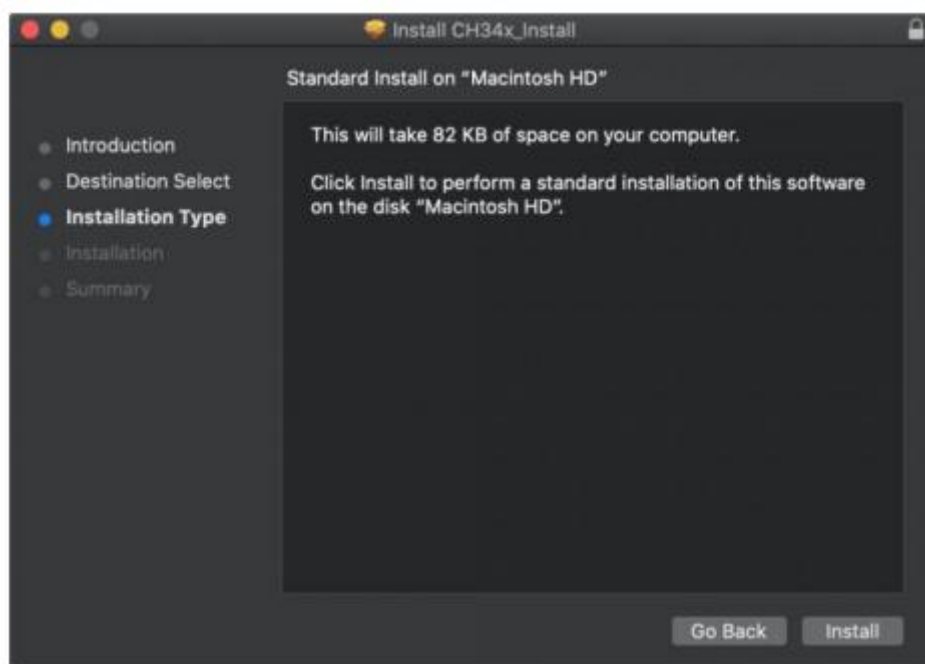

The driver file of the CH340G of the MAC system is provided in the tutorial data package.

Double-click installation package and tap Continue

Click Install

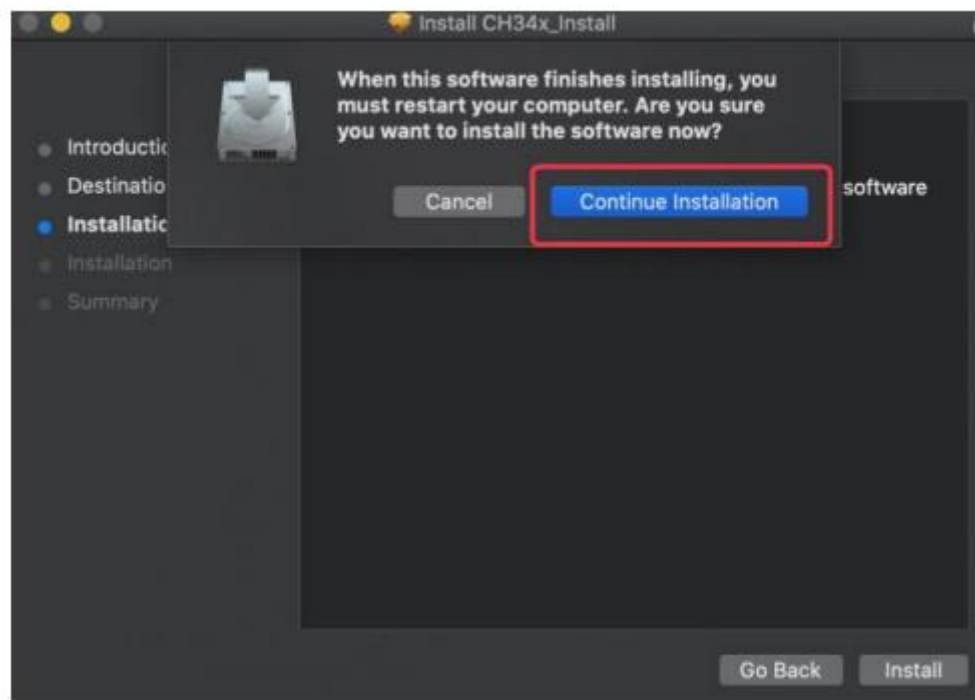

Input your user password and click Install Software

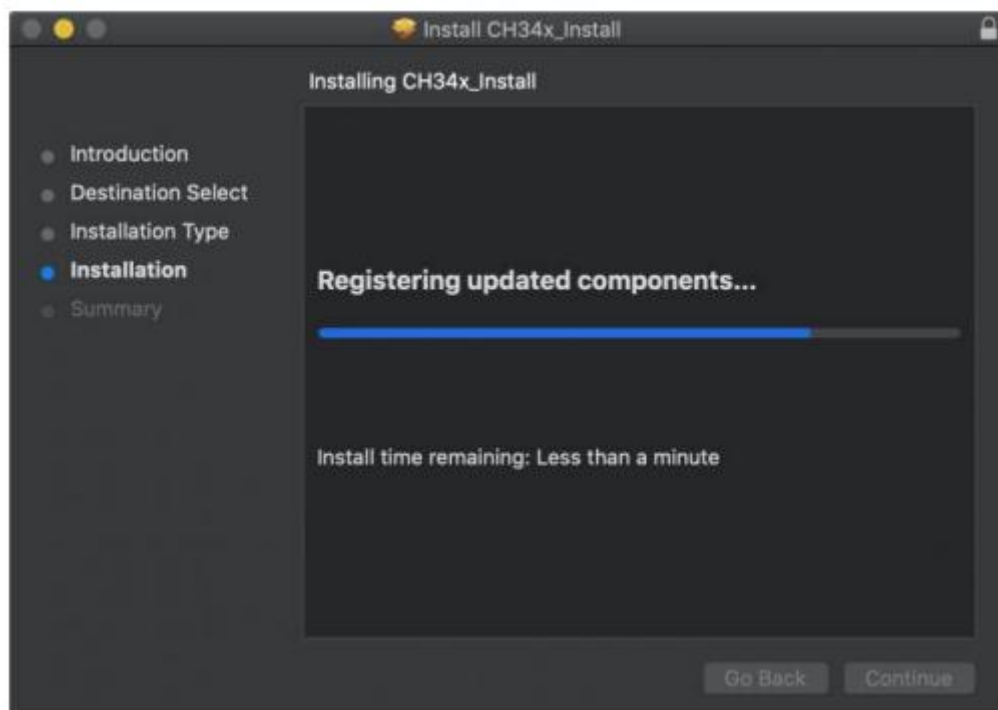

Tap Continue Installation

LROBRUYA

Wait to install

Click Restart after the installation is finished

How to Add Arduino Libraries

Installing Additional Arduino Libraries

Once you are comfortable with the Arduino software and using the built-in functions, you may want to extend the ability of your Arduino with additional libraries.

What are Libraries?

Libraries are a collection of code that makes it easy for you to connect to a sensor, display, module, etc. For example, the built-in Liquid Crystal library makes it easy to talk to character LCD displays. There are

hundreds of additional libraries available on the Internet for download.

The built-in libraries and some of these additional libraries are listed in the reference. To use the additional libraries, you will need to install them.

How to Install a Library

Using the Library Manager

To install a new library into your Arduino IDE you can use the Library Manager (available from IDE version 1.8.0). Open the IDE and click to the "Sketch" menu and then Include Library > Manage Libraries.

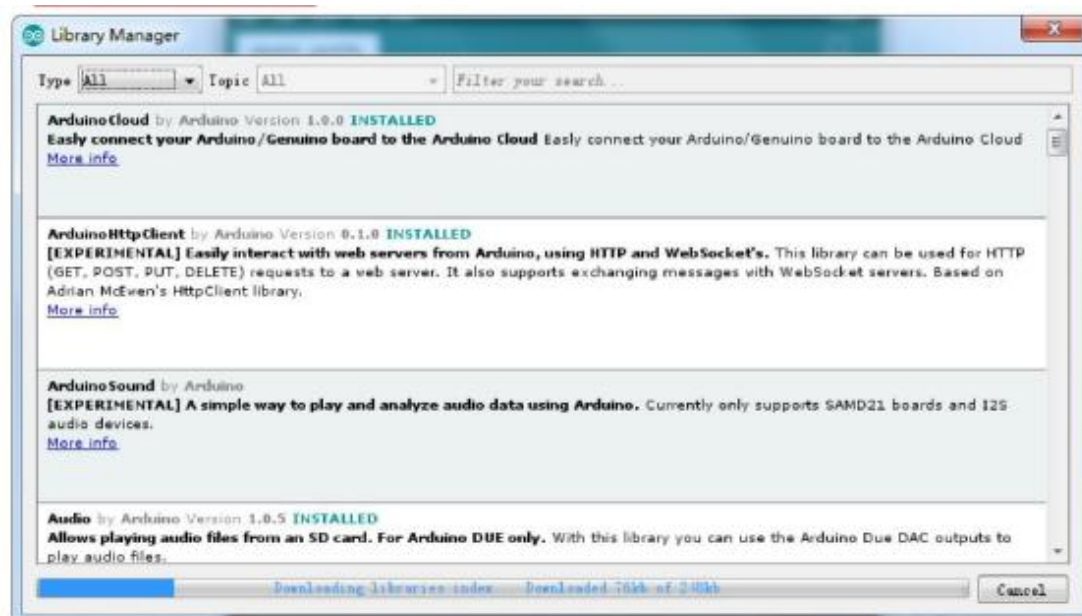

Then the library manager will open and you will find a list of libraries that are already installed or ready for installation. In this example we will install the Bridge library. Scroll the list to find it, then select the version of the library you want to install. Sometimes only one version of the

LROBRUYA

library is available. If the version selection menu does not appear, don't worry: it is normal.

There are times you have to be patient with it, just as shown in the figure. Please refresh it and wait.

Finally click on install and wait for the IDE to install the new library.

LROBRUYA

Downloading may take time depending on your connection speed. Once it has finished, an Installed tag should appear next to the Bridge library.

You can close the library manager.

You can now find the new library available in the Include Library menu.

If you want to add your own library open a new issue on [Github](#).

Importing a .zip Library

Libraries are often distributed as a ZIP file or folder. The name of the folder is the name of the library. Inside the folder will be a .cpp file, a .h file and often a keywords.txt file, examples folder, and other files required by the library. Starting with version 1.0.5, you can install 3rd party libraries in the IDE. Do not unzip the downloaded library, leave it as is.

In the Arduino IDE, navigate to Sketch > Include Library. At the top of

LROBRUYA

the drop down list, select the option to "Add .ZIP Library".

You will be prompted to select the library you would like to add.

Navigate to the .zip file's location and open it.

LROBRUYA

Return to the Sketch > Import Library menu. You should now see the library at the bottom of the drop-down menu. It is ready to be used in your sketch. The zip file will have been expanded in the libraries folder in your Arduino sketches directory. **NB: the Library will be available to use in sketches, but examples for the library will not be exposed in the File > Examples until after the IDE has restarted.**

Blink Test

Overview

In this Project, you will learn how to program your UNO R3 controller board to blink the Arduino's built-in LED, and how to download programs by basic steps.

Component Required:

LONTEN Uno R3 Board* 1

Principle

The UNO R3 board has rows of connectors along both sides that are used to connect to several electronic devices and plug-in 'shields' that extends its capability.

It also has a single LED that you can control from your sketches. This LED is built onto the UNO R3 board and is often referred to as the 'L'

LROBRUYA

LED as this is how it is labeled on the board.

In this Project, we will reprogram the UNO board with our own Blink sketch and then change the rate at which it blinks.

In the previous chapter-How to install Arduino IDE, you set up your Arduino IDE and made sure that you could find the right serial port for it to connect to your UNO board. The time has now come to put that connection to the test and program your UNO board.

The Arduino IDE includes a large collection of example sketches that you can load up and use. This includes an example sketch for making the 'L' LED blink.

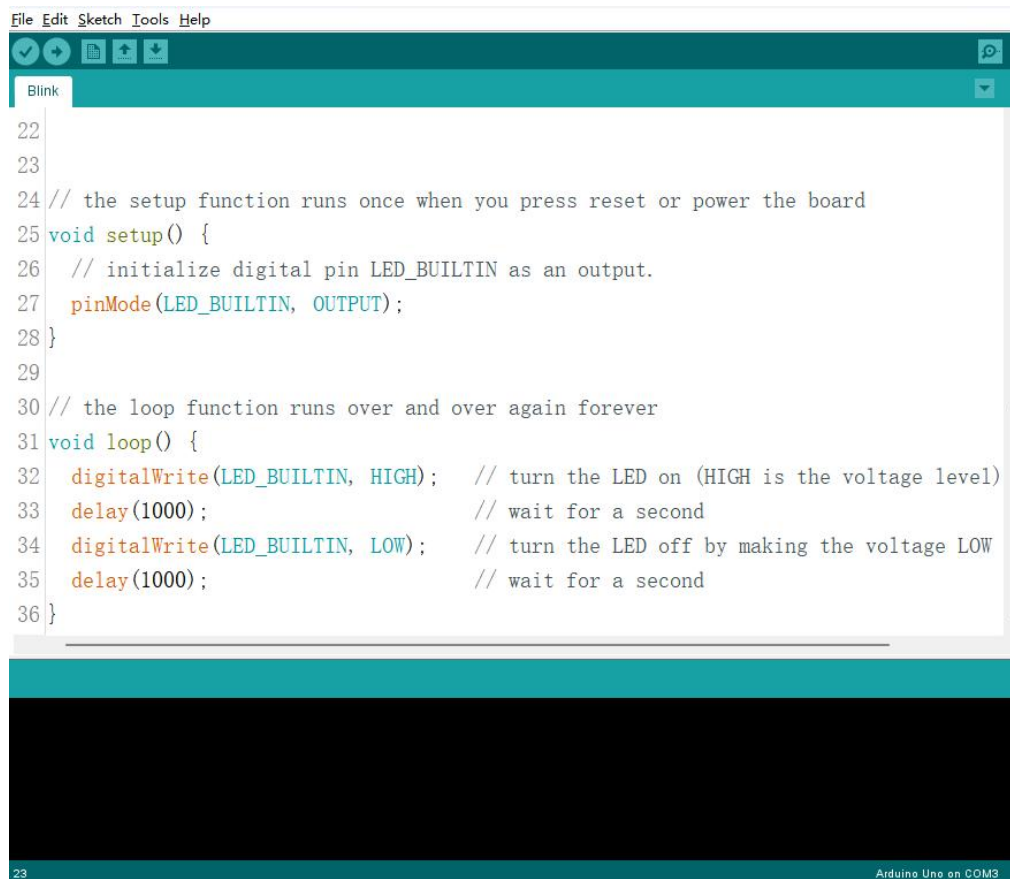

Load the 'Blink' sketch that you will find in the IDE's menu system under File > Examples > 01.Basics>Blink

LROBRUYA

When the sketch window opens, enlarge it so that you can see the entire sketch in the window.

LROBRUYA

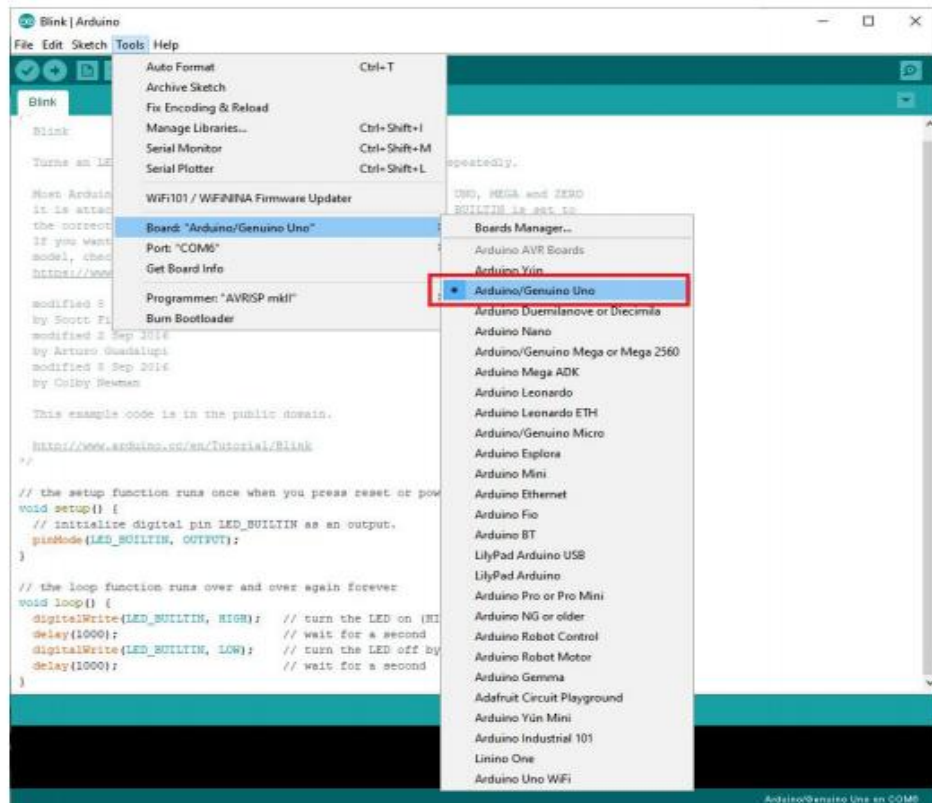

A screenshot of the Arduino IDE interface. The top menu bar includes 'File', 'Edit', 'Sketch', 'Tools', and 'Help'. Below the menu is a toolbar with icons for opening files, saving, and uploading. The main text area displays the 'Blink' sketch code, which is a standard Arduino program for toggling an LED. The code is as follows:

```
22
23
24 // the setup function runs once when you press reset or power the board
25 void setup() {
26   // initialize digital pin LED_BUILTIN as an output.
27   pinMode(LED_BUILTIN, OUTPUT);
28 }
29
30 // the loop function runs over and over again forever
31 void loop() {
32   digitalWrite(LED_BUILTIN, HIGH); // turn the LED on (HIGH is the voltage level)
33   delay(1000); // wait for a second
34   digitalWrite(LED_BUILTIN, LOW); // turn the LED off by making the voltage LOW
35   delay(1000); // wait for a second
36 }
```

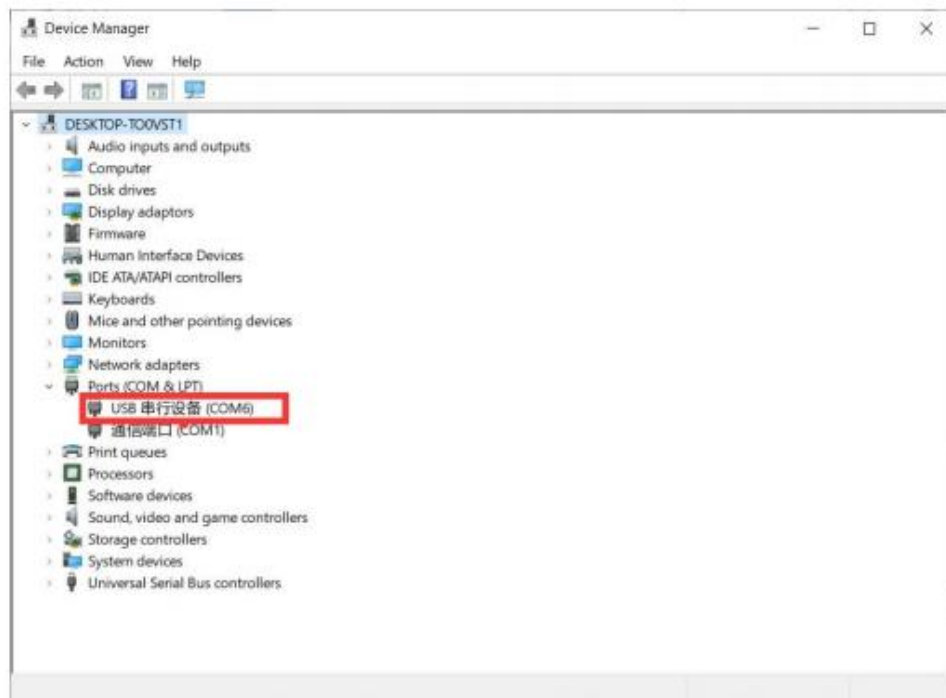

The bottom status bar shows '23' on the left and 'Arduino Uno on COM3' on the right.

Attach your Arduino board to your computer with the USB cable and check that the 'Board Type' and 'Serial Port' are set correctly.

LROBRUYA

LROBRUYA

Note: The Board Type and Serial Port here are not necessarily the same as shown in picture. If you are using UNO, then you will have to choose Arduino UNO as the Board Type, other choices can be made in the same manner. And the Serial Port displayed for everyone is different, despite COM 6 chosen here, it could be COM3 or COM4 on your computer. A right COM port is supposed to be COMX (arduino XXX), which is by the certification criteria.

The Arduino IDE will show you the current settings for board at the bottom of the window.

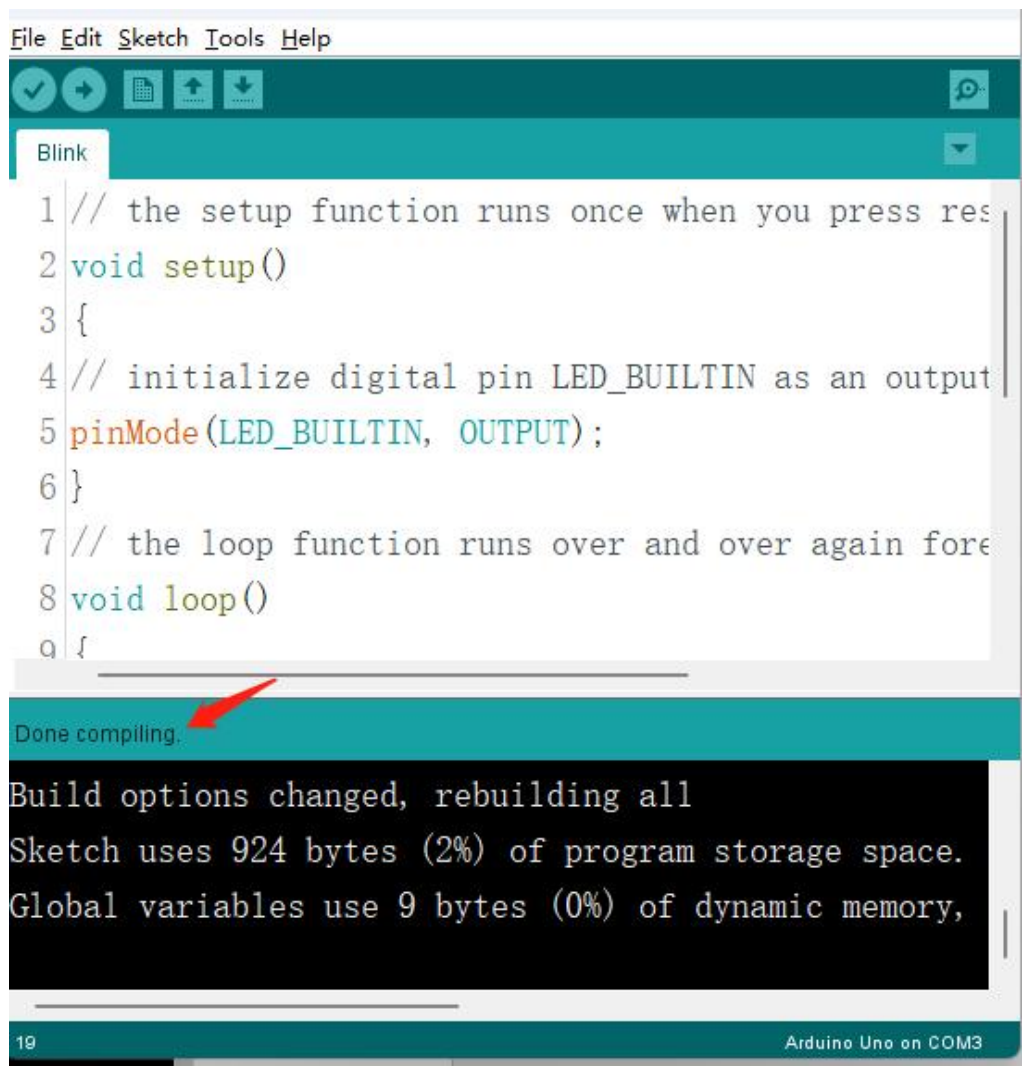

LROBRUYA

Click on the 'Upload' button. The second button from the left on the toolbar.

When the status bar prompts "Done uploading", it means the code upload is successful

LROBRUYA

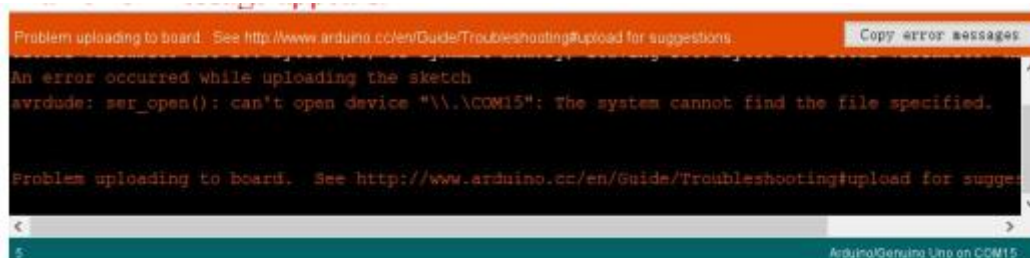

The screenshot shows the Arduino IDE interface. The menu bar includes File, Edit, Sketch, Tools, and Help. The toolbar contains icons for checking, running, saving, and uploading. The sketch is named 'Blink'. The code in the editor is as follows:

```
1 // the setup function runs once when you press reset
2 void setup()
3 {
4 // initialize digital pin LED_BUILTIN as an output
5 pinMode(LED_BUILTIN, OUTPUT);
6 }
7 // the loop function runs over and over again forever
8 void loop()
9 {
```

Below the code editor, a status bar indicates 'Done compiling.' with a red arrow pointing to it. A message box below the status bar states: 'Build options changed, rebuilding all. Sketch uses 924 bytes (2%) of program storage space. Global variables use 9 bytes (0%) of dynamic memory,'. The bottom status bar shows '19' and 'Arduino Uno on COM3'.

If an error message appears.

The screenshot shows the Arduino IDE interface with an error message displayed. The message box at the top states: 'Problem uploading to board. See <http://www.arduino.cc/en/Guide/Troubleshooting#upload> for suggestions. Copy error messages.' Below this, the error message reads: 'An error occurred while uploading the sketch. avrdude: ser_open(): can't open device "\\.\\COM15": The system cannot find the file specified.' The bottom status bar shows 'Arduino Genuine Uno on COM15'.

There can be several reasons:

1. The arduino uno driver software is not installed successfully, please

refer to the course for the installation steps: [How to Install Arduino Driver](#).

2. The communication serial port selection of arduino uno is wrong; you can check the communication port COMx of your arduino uno in the computer in the device manager.

3. If your Arduino uno is connected to a Bluetooth module, it will occupy the communication serial port. You need to remove the Bluetooth module connection before uploading the code.

4. The USB data cable is not firmly connected. Check if there are any of the above problems. After correcting, follow the previous steps to re-operate.

Sample Program

```
// the setup function runs once when you press reset or power the board

void setup()

{

// initialize digital pin LED_BUILTIN as an output.
pinMode(LED_BUILTIN, OUTPUT);

}

// the loop function runs over and over again forever

void loop()

{

digitalWrite(LED_BUILTIN, HIGH);

// turn the LED on (HIGH is the voltage level)

delay(1000);

// wait for a second

digitalWrite(LED_BUILTIN, LOW);

// turn the LED off by making the voltage LOW

delay(1000);

// wait for a second

}
```

LROBRUYA

After the code is successfully uploaded, the "L" character LED will flash once per second. So far, you have completed the testing process of your first program.

Project 1 Hello World

Overview

As for starters, we will begin with something simple. In this project, you only need an Arduino and a USB Cable to start the "Hello World!" experiment. It is not only a communication test of your Arduino and PC, but also a primer project for you to have your first try in the Arduino world!

Component Required:

1.LONTEN Uno R3 Board *1

2.USB Cable *1

Arduino Serial Monitor (Windows, Mac, Linux)

The Arduino Integrated Development Environment (IDE) is the software side of the Arduino platform. And, because using a terminal is such a big part of working with Arduino and other microcontrollers, they decided to include a serial terminal with the software. Within the Arduino environment, this is called the Serial Monitor.

Sample Program

Open the program “Project_1_Hello_World.ino” in the folder
Arduino_Code—>Project_1_Hello_World.

```
////////////////////////////////////
```

```
int value;//define variable value
```

```
int ledpin=13;// define digital interface 13
```

```
void setup()
```

```
{
```

```
    Serial.begin(9600);// set the baud rate at 9600 to match the software set  
up. When connected to a specific device, (e.g. bluetooth), the baud rate  
needs to be the same with it.
```

`pinMode(ledpin,OUTPUT);`// initialize digital pin 13 as output. When using I/O ports on an Arduino, this kind of set up is always needed.

`digitalWrite(ledpin,LOW);`// initialize set the LED on digital pin 13 off.
`}`

`void loop()`

`{`

`value=Serial.read();`// read the instruction or character from PC to Arduino, and assign them to Val.

`if(value=='L')`// determine if the instruction or character received is “L”.
`{`

`// if it's “L”,`

`digitalWrite(ledpin,HIGH);`// set the LED on digital pin 13 on.

`delay(500);`

`digitalWrite(ledpin,LOW);`// set the LED on digital pin 13 off.

`delay(500);`

`Serial.println("Hello World!");`// display “Hello World! ” string.

`}`

`else`// determine the instruction or character not received.

`digitalWrite(ledpin,LOW);`// set the LED on digital pin 13 off.

`}`

}////////////////////

Code Test

Select the correct COM communication serial port, click the button to upload the code. if you encounter an error during the code upload process, you can refer to the previous course “[Blink Test](#)”.

```
1 int value; //define variable value
2 int ledpin=13; // define digital interface 13
3 void setup()
4 {
5   Serial.begin(9600); // set the baud rate at 9600 to match the software set up. When connected to a specific device, (e.g. bluetooth), the baud rate needs to be the same with it.
6   pinMode(ledpin,OUTPUT); // initialize digital pin 13 as output. When using I/O ports on an Arduino, this kind of set up is always needed.
7   digitalWrite(ledpin,LOW); // initialize set the LED on digital pin 13 off.
8 }
9 void loop()
10 {
11   value=Serial.read(); // read the instruction or character from PC to Arduino, and assign them to Val.
12   if(value=='L') // determine if the instruction or character received is "L".
13   { // if it's "L",
14     digitalWrite(ledpin,HIGH); // set the LED on digital pin 13 on.
15     delay(500);
16     digitalWrite(ledpin,LOW); // set the LED on digital pin 13 off.    delay(500);
17     Serial.println("Hello World!"); // display "Hello World! " string.
18   }
19   else{// determine the instruction or character not received.
20     digitalWrite(ledpin,LOW); // set the LED on digital pin 13 off.
21   }
22 }
23
```

After completing the code upload, click the Serial Monitor icon to open it.

The screenshot shows the same Arduino IDE code editor as before. A red arrow points to the Serial Monitor icon in the top toolbar, which is the icon with a magnifying glass over a document.

Click on the baud rate drop-down menu to select the correct baud rate.

LROBRUYA

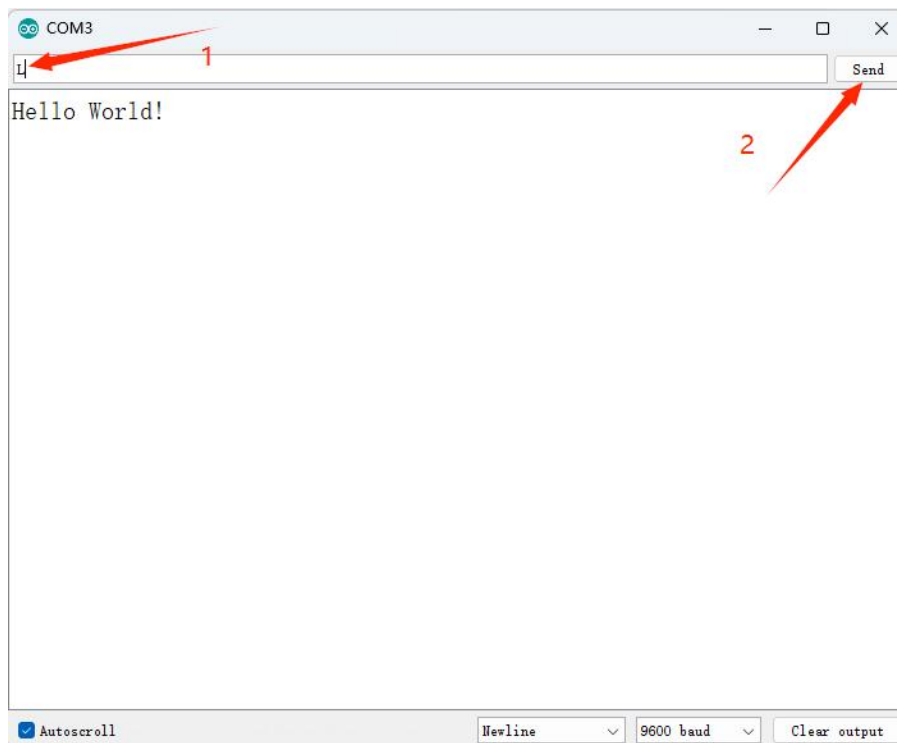

(9600 baud)

Last, you can set the terminal to Autoscroll or not by checking the box in the bottom left corner.

Click to open serial port monitor, input an “L”, LED 13 will blink once, PC will receive the information from Arduino: Hello World!

Project 2 LED Blinking

Introduction

Blinking LED experiment is quite simple. In the “Hello World!” program, we have come across LED. This time, we are going to connect an LED to one of the digital pins rather than using LED13, which is soldered to the board. Except an Arduino and an USB cable, we will need extra parts as below.

Hardware Required

- 1.LONTEN Uno R3 Board *1
- 2.USB Cable *1
3. Red M5 LED*1
4. 220Ω Resistor*1
5. Breadboard*1
6. Breadboard Jumper Wires* Several

LED:

LEDs make great indicator lights. They use very little electricity and they pretty much last forever.

In this Project, you will use perhaps the most common of all LEDs: a 5mm red LED. 5mm refers to the diameter of the LED. Other common sizes are 3mm and 10mm. You cannot directly connect an LED to a

LROBRUYA

battery or voltage source because 1) the LED has a positive and a negative lead and will not light if placed the wrong way and 2) an LED must be used with a resistor to limit or 'choke' the amount of current flowing through it; otherwise, it will burn out!

If you do not use a resistor with an LED, then it may well be destroyed. almost immediately, as too much current will flow through, heating it and destroying the 'junction' where the light is produced.

There are two ways to tell which is the positive lead of the LED and which the negative.

Firstly, the positive lead is longer.

Secondly, where the negative lead enters the body of the LED, there is a flat edge to the case of the LED.

If you happen to have an LED that has a flat side next to the longer lead, you should assume that the longer lead is positive.

RESISTORS:

As the name suggests, resistors resist the flow of electricity. The higher the value of the resistor, the more it resists and the less electrical current.

LROBRUYA

will flow through it. We are going to use this to control how much electricity flows through the LED and therefore, how brightly it shines.

But first, more about resistors...

The unit of resistance is called the Ohm, which is usually shortened to Ω the Greek letter Omega. Because an Ohm is a low value of resistance (it doesn't resist much at all), we also denote the values of resistors in $K\Omega$ (1,000 Ω) and $M\Omega$ (1,000,000 Ω).

These are called kilo-ohms and mega-ohms.

In this learning kit, we are going to use three different values of resistor:

220 Ω , 1K Ω and 10K Ω . These resistors all look the same, except that they have different colored stripes on them. These stripes tell you the value of the resistor.

The resistor color code has three colored stripes and then a gold stripe at one end.

LROBRUYA

Unlike LEDs, resistors do not have a positive and negative lead. They can be connected either way around.

If you find this approach method too complicated, you can read the color ring flag on our resistors directly to determine its resistance value. Or you may use a digital multimeter instead.

We follow below diagram from the experimental schematic link. Here we use digital pin 10. We connect LED to a 220-ohm resistor to avoid high current damaging the LED.

Circuit Connection

Sample Program

According to the above circuit, you can start compiling the program, turning the LED 1 second on and 1 second off. This program is simple and like one that comes with Arduino except it's connected to digital pin 10.

```
////////////////////////////////////
```

```
int ledPin = 10; // define digital pin 10.
```

```
void setup()
```

```
{  
  
pinMode(ledPin, OUTPUT); // define pin with LED connected as output.  
  
}  
  
void loop()  
  
{  
  
digitalWrite(ledPin, HIGH); // set the LED on.  
  
Delay(1000); // wait for a second.  
  
DigitalWrite(ledPin, LOW); // set the LED off.  
  
Delay(1000); // wait for a second  
  
}  
  
////////////////////////////////////
```

Result

After downloading this program, in the experiment, you will see the LED connected to pin 10 turning on and off, with an interval approximately one second.

Project 3 Traffic Light

Introduction

In the previous program, we have done the LED blinking experiment with one LED. Now, it's time to up the stakes and do a bit more complicated experiment-traffic light. These two experiments are similar.

While in this traffic lights experiment, we use 3 LEDs with different color other than 1 LED.

Hardware Required

- 1.LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Red M5 LED*1
- 4.Yellow M5 LED*1
- 5.Green M5 LED*1
- 6.220Ω Resistor *3

7.Breadboard*1

8.Breadboard Jumper Wires* Several

Circuit Connection

Sample Program

Since it is a simulation of traffic lights, the blinking time of each LED should be the same with those in traffic lights system. In this program, we use Arduino delay () function to control delay time, which is much simpler than C language.

```
////////////////////////////////////
```

```
int redled =10; // initialize digital pin 10.
```

```
int yellowled =7; // initialize digital pin 7.
```

```
int greenled =4; // initialize digital pin 4.
```

```
void setup()
```

```
{
```

```
  pinMode(redled, OUTPUT); // set the pin with red LED as “output”
```

```
  pinMode(yellowled, OUTPUT); // set the pin with yellow LED as
```

```
“output”
```

```
  pinMode(greenled, OUTPUT); // set the pin with blue LED as “output”
```

```
}
```

```
void loop()
```

```
{
```

```
  digitalWrite(greenled, HIGH); /// turn on green LED
```

```
  delay(2000); // wait 2 seconds
```

```
  digitalWrite(greenled, LOW); // turn off green LED
```

```
  for(int i=0;i<3;i++) // blinks for 3 times
```

```
  {
```

```
    delay(500); // wait 0.5 second
```

```
    digitalWrite(greenled, HIGH); // turn on green LED
```

```
    delay(500);// wait 0.5 second

    digitalWrite(greenled, LOW);// turn off green LED
}

digitalWrite(yellowled, HIGH);//// turn on yellow LED

delay(3000);// wait 3 seconds

digitalWrite(yellowled, LOW); // turn off yellow LED

digitalWrite(redled, HIGH);// turn on red LED

delay(3000);// wait 3 second

digitalWrite(redled, LOW);// turn off red LED

}*****
```

Result

When the uploading process is completed, we can see traffic lights of our own design.

Describe: The green light will be on for 2 seconds, and then off, followed by the green light blinking for 3 times, and then the yellow light on for 3 seconds, and then the red light on for 3 seconds, forming a cycle. Cycle then repeats.

Project 4 Digital Inputs

Introduction

I/O port means interface for INPUT and OUTPUT. Up until now, we have only used its OUTPUT function. In this experiment, we will try to use the input function, which is to read the output value of device connecting to it. We use 1 button and 1 LED using both input and output to give you a better understanding of the I/O function. Push Buttons, familiar to most of us, are a switch value (digital value) component. When it's pressed, the circuit is in closed (conducting) state.

Hardware Required

1. LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Push Button*1

4.Red M5 LED*1

5.220 Ω Resistor*1

6.10K Ω Resistor*1

7.Breadboard*1

8.Breadboard Jumper Wires* Several

Circuit Connection

Sample Program

Now, let's begin the compiling. When the button is pressed, the LED will be on. After the previous study, the coding should be easy for you. In this

program, we add a statement of judgment. Here, we use an if () statement. Arduino IDE is based on C language, so statements of C language such as while, switch etc. Can certainly be used for Arduino program. When we press the button, pin 7 will output high level. We can program pin 11 to output high level and turn on the LED. When pin 7 outputs low level, pin 11 also outputs low level and the LED remains off.

```
////////////////////////////////////
```

```
int Redled=11;// initialize Redled 11
```

```
int inpin=7;// initialize pin 7
```

```
int val;// define val
```

```
void setup()
```

```
{
```

```
    pinMode(Redled,OUTPUT);// set LED pin as “output”
```

```
    pinMode(inpin,INPUT);// set button pin as “input”
```

```
}
```

```
void loop()
```

```
{
```

```
    val=digitalRead(inpin);// read the level value of pin 7 and assign if
```

```
to val
```

```
if(val==LOW)// check if the button is pressed, if yes, turn on the
LED
{
    digitalWrite(Redled,HIGH);
}
else
{
    digitalWrite(Redled,LOW);
}
}////////////////////////
```

Result

When the button is pressed, LED is on, otherwise, LED remains off.

After the above process, the button controlled LED experiment is completed. The simple principle of this experiment is widely used in a variety of circuit and electric appliances. You can easily come across it in your every day life. One typical example is when you press a certain key of your phone, the backlight will be on.

Project 5 Active Buzzer

Introduction

Active buzzer is widely used on computer, printer, alarm, electronic toy, telephone, timer etc.. It has an inner vibration source. Simply connect it with 5V power supply, it can buzz continuously.

Hardware Required

1. LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Active Buzzer*1
- 4.Breadboard*1
- 5.Breadboard Jumper Wires* Several

Circuit Connection

When connecting the circuit, pay attention to the positive & the negative poles of the buzzer. In the photo, you can see there are red and black lines.

When the circuit is finished, you can begin programming.

Sample Program

Program is simple. You control the buzzer by outputting high/low level.

```
////////////////////////////////////
```

```
int buzzer=8;// initialize digital IO pin that controls the buzzer
```

```
void setup()
{
  pinMode(buzzer,OUTPUT);// set pin mode as “output”
}

void loop()
{
  digitalWrite(buzzer, HIGH); // produce sound
  delay(1000);
  digitalWrite(buzzer, LOW);
  delay(1000);
}////////////////////////
```

Result

After downloading the program, the buzzer experiment is completed. You can see the buzzer is ringing.

Project 6 Passive Buzzer

Introduction

We can use Arduino to make many interactive works of which the most commonly used is acoustic-optic display. All the previous experiment has something to do with LED. However, the circuit in this experiment can produce sound. Normally, the experiment is done with a buzzer or a speaker while buzzer is simpler and easier to use. The buzzer we introduced here is a passive buzzer. It cannot be actuated by itself, but by external pulse frequencies. Different frequencies produce different sounds. We can use Arduino to code the melody of a song, which is actually quite fun and simple.

Hardware Required

1. LONTEN Uno R3 Board *1
- 2.USB Cable *1

3.Passive Buzzer*1

4.Breadboard*1

5.Breadboard Jumper Wires* Several

Circuit Connection

Sample Program

```
////////////////////////////////////
```

```
int buzzer=8;// select digital IO pin for the buzzer
```

```
void setup() {
```

```
pinMode(buzzer,OUTPUT);// set digital IO pin pattern, OUTPUT to be
```

```
output }

void loop() {

unsigned char i,j;//define variable

while(1) {

for(i=0;i<80;i++)// output a frequency sound

{ digitalWrite(buzzer,HIGH);// sound

delay(1);//delay 1ms

digitalWrite(buzzer,LOW);//not sound

delay(1);//delay 1ms }

for(i=0;i<100;i++)// output a frequency sound

{ digitalWrite(buzzer,HIGH);// sound

delay(1);//delay 1ms

digitalWrite(buzzer,LOW);//not sound

delay(2);//delay 2ms }

}

}

////////////////////////////////////
```

Result

After downloading the program, The buzzer will emit a rapid alarm sound.

Project 7 RGB Module

Introduction

In this experiment, we will learn how to use RGB module.

RGB module are made from a patch of full-color LED. By adjusting the voltage input of R, G, B pins, we can adjust the strength of the three primary colors (red/blue/green) so to implementation result of full color effect.

Hardware Required:

1. LONTEN UNO Board * 1
- 2.USB Cable* 1
- 3.RGB module* 1
- 4.Breadboard* 1
- 5.Breadboard Jumper Wires* Several

Circuit Connection

LROBRUYA

Sample Program

```
////////////////////////////////////////////////////////////////
```

```
int redpin = 11; //select the pin for the red LED

int greenpin =10; // select the pin for the green LED

int bluepin =9; // select the pin for the blue LED

int val;

void setup() {

    pinMode(redpin, OUTPUT);

    pinMode(bluepin, OUTPUT);

    pinMode(greenpin, OUTPUT);

    Serial.begin(9600);

}

void loop()
```

LROBRUYA

```
{  
  for(val=255; val>0; val--)  
  {  
    analogWrite(11, val);  
    analogWrite(10, 255-val);  
    analogWrite(9, 128-val);  
    delay(50);  
  }  
  for(val=0; val<255; val++)  
  {  
    analogWrite(11, val);  
    analogWrite(10, 255-val);  
    analogWrite(9, 128-val);  
    delay(50);  
  }  
  Serial.println(val, DEC);  
}  
////////////////////////////////////
```

Result

After we connect the circuit as the picture, we upload the program of each module. We can see the module changing their color as the code set. If you want to make it change the color in different way, you can revise the code.

Project 8 Analog Value Reading

Introduction

In this experiment, we will begin the learning of analog I/O interfaces. On an Arduino, there are 6 analog interfaces numbered from A0 to A5. These 6 interfaces can also be used as digital ones numbered as D14-D19. After a brief introduction, let's begin our project. Potentiometer used here is a typical output component of analog value that is familiar to us.

Hardware Required

1.LONTEN Uno R3 Board *1

2.USB Cable *1

3.Potentiometer *1

4.Breadboard*1

5.Breadboard Jumper Wires* Several

Circuit Connection

In this experiment, we will convert the resistance value of the potentiometer to analog ones and display it on the screen. This is an application we need to master well for our future experiments.

Connection circuit as below:

The analog interface we use here is interface A0.

Sample Program

The program compiling is simple. An `analogRead ()` Statement can read the value of the interface. The A/D acquisition of Arduino 328 is in 10 bits, so the value it reads is among 0 to 1023. One difficulty in this project is to display the value on the screen, which is actually easy to learn. First, we need to set the baud rate in void `setup ()`. Displaying the

value is a communication between Arduino and PC, so the baud rate of the Arduino should match the one in the PC's software setup. Otherwise, the display will be messy codes or no display at all. In the lower right corner of the Arduino software monitor window, there is a button for baud rate set up. The set up here needs to match the one in the program. The statement in the program is `Serial.begin()`; enclosed is the baud rate value, followed by statement for displaying. You can either use `Serial.print()` or `Serial.println()` statement.

```
////////////////////////////////////
```

```
int potpin=0;// initialize analog pin A0
```

```
int ledpin=13;// initialize digital pin 13
```

```
int val=0;// define val, assign initial value 0
```

```
void setup()
```

```
{
```

```
pinMode(ledpin,OUTPUT);// set digital pin as “output”
```

```
Serial.begin(9600);// set baud rate at 9600
```

```
}
```

```
void loop()
```

```
{
```

```
digitalWrite(ledpin,HIGH);// turn on the LED on pin 13
```

```
delay(50);// wait for 0.05 second

digitalWrite(ledpin,LOW);// turn off the LED on pin 13

delay(50);// wait for 0.05 second

val=analogRead(potpin);// read the analog value of analog pin 0, and
assign it to val

Serial.println(val);// display val's value

}
```

////////////////////////////////////

Result

The Sample Program uses the built-in LED connected to pin 13. Each time the device reads a value, the LED blinks. Below is the analog value it reads.

When you rotate the potentiometer knob, you can see the displayed value changes. The reading of analog value is a very common function since most sensors output analog value. After calculation, we can have the corresponding value we need.

Project 9 Photo Resistor

Introduction

After completing all the previous experiments, we acquired some basic understanding and knowledge about Arduino application. We have learned digital input and output, analog input and PWM. Now, we can begin the learning of sensors applications. Photo resistor (Photoresistor) is a resistor whose resistance varies according to different incident light strength. It's made based on the photoelectric effect of semiconductor. If the incident light is intense, its resistance reduces; if the incident light is weak, the resistance increases.

Photovaristor is commonly applied in the measurement of light, light control and photovoltaic conversion (convert the change of light into the change of electricity). Photo resistor is also being widely applied to various light control circuit, such as light control and adjustment, optical switches etc. We will start with a relatively simple experiment regarding photovaristor application. Photovaristor is an element that changes its resistance as light strength changes. So we will need to read the analog values. We can refer to the PWM experiment, replacing the potentiometer with photovaristor. When there is change in light strength, there will be corresponding change on the LED.

Hardware Required

- 1.LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Photo Resistor*1
- 4.Red M5 LED*1
- 5.10K Ω Resistor*1
- 6.220 Ω Resistor*1
- 7.Breadboard*1
- 8.Breadboard Jumper Wires* Several

Circuit Connection

Sample Program

After the connection, let's begin the program compiling. The program is similar to the one of PWM. For change detail, please refer to the Sample Program below.

```
////////////////////////////////////
```

```
int potpin=0;// initialize analog pin A0, connected with photovaristor
```

```
int ledpin=11;// initialize digital pin 11, output regulating the brightness  
of LED
```

```
int val=0;// initialize variable val
```

```
void setup()

{

pinMode(ledpin,OUTPUT);// set digital pin 11 as “output”

Serial.begin(9600);// set baud rate at “9600”

}

void loop()

{

val=map ( analogRead(potpin) , 0 , 1023 , 0 , 255);

// read the analog value of the sensor and assign it to val

Serial.println(val);// display the value of val

analogWrite(ledpin,val);

// turn on the LED and set up brightness (maximum output value 255)

delay(10);// wait for 0.01

}

////////////////////////////////////
```

Result

After downloading the program, you can change the light strength around the photovaristor and see corresponding brightness change of the LED.

Photovaristors has various applications in our everyday life. You can make other interesting interactive projects base on this one.

Project 10 Water Level Detection Sensor Module

Introduction

In this lesson, you will learn how to use a water level detection sensor module. This module can perceive the depth of water and the core component is an amplifying circuit which is made up of a transistor and several pectinate PCB routings. When put into the water, these routings will present a resistor that can change along with the change of the water's depth. Then, the signal of water's depth is converted into the electrical signal, and we can know the change of water's depth through the ADC function of UNO R3.

Hardware Required

- 1.LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Water Level Detection Sensor Module*1
- 4.Breadboard*1
- 5.Breadboard Jumper Wires* Several

Water sensor:

A water sensor brick is designed for water detection, which can be widely used in sensing the rainfall, water level, even the liquate leakage. The brick is mainly composed of three parts: an electronic brick connector, a

1 M Ω resistor, and several lines of bare conducting wires. You can use it with the analog pins to detect the amount of water induced contact between the grounded and sensor traces. This item can judge the water level through with a series of exposed parallel wires stitch to measure the water droplet/water size. It can easily change the water size to analog signal, and output analog value can directly be used in the program function, then to achieve the function of water level alarm. It has low power consumption, and high sensitivity.

Features:

1. Working voltage: 5V
2. Working Current: <20ma
3. Interface: Analog
4. Width of detection: 40mm×16mm
5. Working Temperature: 10°C~30°C
6. Output voltage signal: 0~4.2V

Circuit Connection

Wiring tips: Power supply (+) is connected to 5V of UNO R3 board, ground electrode (-) is connected to GND. Signal output (S) is connected to the ports (A0-A5) which have function of inputting analog signal in UNO R3 board, random one is OK, but it should define the same demo code as the routine.

Sample Program

The voltage value received by the analog pin represents the water level value. Each time the change is greater than 10, the value can be updated in the serial port.

```
//////////
```

```
int adc_id = 0;
```

```
int HistoryValue = 0;
```

```
char printBuffer[128];
```

```
void setup() {
```

```
  Serial.begin(9600);
```

```
}
```

```
void loop() {
```

```
  int value = analogRead(adc_id); // get adc value
```

```
  if(((HistoryValue>=value) && ((HistoryValue - value) > 10)) ||
```

```
  ((HistoryValue<value) && ((value - HistoryValue) > 10))) {
```

```
    sprintf(printBuffer,"ADC%d level is %d\n",adc_id, value);
```

```
    Serial.print(printBuffer);
```

```
    HistoryValue = value;
```

```
  } }
```

```
//////////
```

AO: analog output, real-time output voltage signal of microphone

DO: when the intensity of the sound reaches a certain threshold, the output is a high or low level signal. The threshold sensitivity can be achieved by adjusting the potentiometer.

To make sure the microphone can detect your voice normally, please try to change its sensitivity by turning the blue precise potentiometer on the module.

Hardware Required

- 1.LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Sound Sensor Module*1
- 4.Breadboard*1
- 5.Breadboard Jumper Wires* Several

LROBRUYA

Circuit Connection

Sample Program

When the sound is greater than the sound threshold set by the blue potentiometer, the D0 interface will output a high level "1", and the LED will light up for 3 seconds and then turn off. This is the sound-controlled light in the corridor in our lives.

```
////////////////////
```

```
int sensorPin = 7;
```

```
int ledPin = 12;
```

```
// select the pin for the LED
```

```
void setup()

{

pinMode(ledPin,OUTPUT);

pinMode(sensorPin,INPUT);

}

void loop(){

if(1==digitalRead(sensorPin))

{digitalWrite(ledPin,HIGH);

delay(3000);

digitalWrite(ledPin,LOW);

}else

{digitalWrite(ledPin,LOW);

}

}

////////////////////
```

Result

You can blow a breath at the microphone of the sound module or clap your hands with both hands next to the microphone, the LED light will light up and go out after 3 seconds.

Project 12 Infrared Obstacle Avoidance Module

Introduction

The infrared obstacle detector sensor has a pair of infrared transmitting and receiving tubes. The transmitter emits an infrared rays of a certain frequency. When the detection direction encounters an obstacle(reflecting surface), the infrared rays are reflected back, and receiving tube will receive it. At this time, the indicator (green LED) lights up. After processed by the circuit, the signal output terminal will output Digital signal. You can rotate the potentiometer on the shield to adjust the detection distance. It is better to adjust the potentiometer to make the green LED in a state between on and off. The detection distance is the best, almost 10cm.

Read the signal level of obstacle detector sensor to judge whether detect obstacles or not.

When detects an obstacle, sensor's signal pin outputs LOW (display 0); otherwise, output HIGH (display 1).

Show the result on the serial monitor, and control the external LED module turn ON/OFF.

Hardware Required

1. LONTEN Uno R3 Board *1
- 2.USB Cable *1
- 3.Infrared Obstacle Avoidance Module*1
- 4.Active Buzzer*1
- 5.Breadboard*1
6. Breadboard Jumper Wires* Several

LROBRUYA

Circuit Connection

Sample Program

When an obstacle is detected, the OUT pin of the module outputs a low level "0", and the buzzer will sound.

```
////////////////////
```

```
int  sensorPin  =  7;
```

```
int  buzzPin   =  12;
```

```
void setup(){
```

```
    pinMode(buzzPin,OUTPUT);
```

```
    pinMode(sensorPin,INPUT);
```

```
}  
  
void loop(){  
    if(0==digitalRead(sensorPin)){  
        digitalWrite(buzzPin,HIGH);  
    }  
    else{  
        digitalWrite(buzzPin,LOW);  
    }  
}////////////////////
```

Result

You can put your hand directly in front of the infrared pair tube of the sensor. The buzzer will sound. After removing the handle, the buzzer stops beeping.

Project 13 DHT11 Temperature and Humidity Sensor

Introduction

This DHT11 Temperature and Humidity Sensor features calibrated digital signal output with the temperature and humidity sensor complex. Its technology ensures high reliability and excellent long-term stability. A high-performance 8-bit microcontroller is connected. This sensor includes a resistive element and a sense of wet NTC temperature measuring devices. It has excellent quality, fast response, anti-interference ability and high cost performance advantages. Each DHT11 sensor features extremely accurate calibration data of humidity calibration chamber. The calibration coefficients stored in the OTP program memory, internal sensors detect signals in the process, and we should call these calibration coefficients. The single-wire serial interface system is integrated to make it quick and easy. Qualities of small size, low power, and 20-meter signal transmission distance make it a wide applied application and even the most demanding one. Convenient connection, special packages can be provided according to users need.

Hardware Required

- 1.Uno R3 Board *1
- 2.USB Cable *1
- 3.Temperature and Humidity Unit *1
- 4.Breadboard*1
- 5.Breadboard Jumper Wires* Several

Circuit Connection

Sample Program

You need to add the library file <DHT11> before compiling and downloading the program, otherwise an error will occur in the compiled

file. For details on adding library files, refer to the course [How to Add Arduino Libraries](#).

```
////////////////
```

```
#include <dht11.h>
```

```
dht11 DHT;
```

```
#define DHT11_PIN 7
```

```
void setup()
```

```
{
```

```
Serial.begin(9600);
```

```
Serial.println("DHT TEST PROGRAM ");
```

```
Serial.print("LIBRARY VERSION: ");
```

```
Serial.println(DHT11LIB_VERSION);
```

```
Serial.println();
```

```
Serial.println("Type,\tstatus,\tHumidity (%),\tTemperature (C)");
```

```
}
```

```
void loop()
```

```
{
```

```
int chk;
```

```
Serial.print("DHT11, \t");
```

```
chk = DHT.read(DHT11_PIN);
```

```
// READ DATA
```

```
switch (chk){
```

```
case DHTLIB_OK:
```

```
Serial.print("OK,\t");
```

```
break;
```

```
case DHTLIB_ERROR_CHECKSUM:
```

```
Serial.print("Checksum error,\t");
```

```
break;
```

```
case DHTLIB_ERROR_TIMEOUT:
```

```
Serial.print("Time out error,\t");
```

```
break;
```

```
default:
```

```
Serial.print("Unknown error,\t");
```

```
break;
```

```
}
```

```
// DISPLAT DATA
```

```
Serial.print(DHT.humidity,1);
```

```
Serial.print(",\t");
```

```
Serial.println(DHT.temperature,1);
```

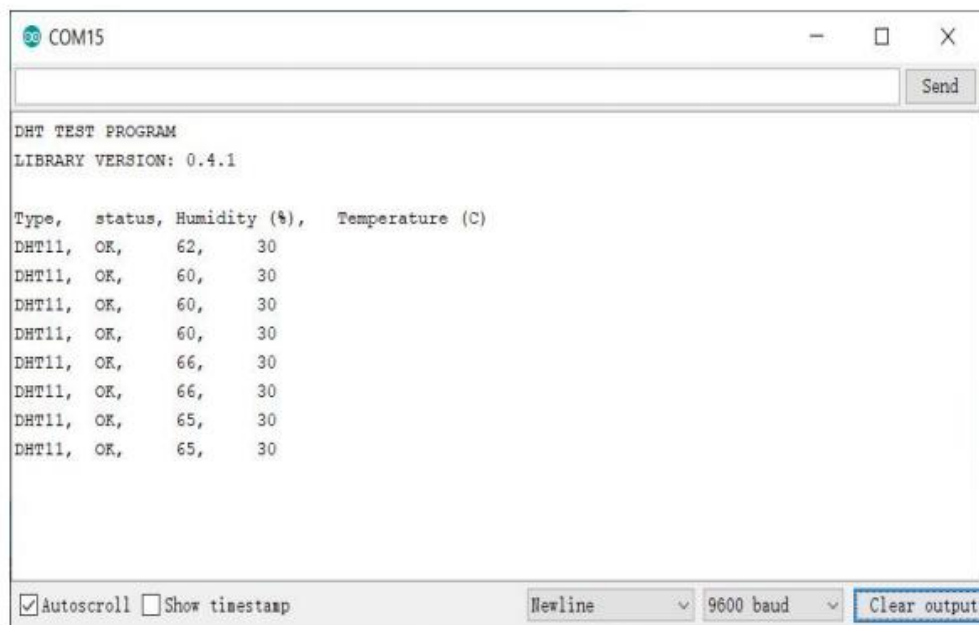

```
delay(1000);
```

```
}
```

```
//////////
```

Result

After uploading the code, the serial monitor will print the temperature and humidity values of the current environment.

Project 14 Digit LED Segment Display

Introduction

LED segment displays are common for displaying numerical information.

It's widely applied on displays of electromagnetic oven, full automatic washing machine, water temperature display, electronic clock etc. It is necessary that we learn how it works. LED segment display is a

semiconductor light-emitting device. Its basic unit is a light-emitting diode (LED). LED segment display can be divided into 7-segment display and 8-segment display according to the number of segments. 8-segment display has one more LED unit (for decimal point display) than 7-segment one. In this experiment, we use a 8-segment display.

According to the wiring method of LED units, LED segment displays can be divided into display with common anode and display with common cathode. Common anode display refers to the one that combine all the anodes of LED units into one common anode (COM). For the common anode display, connect the common anode (COM) to +5V. When the cathode level of a certain segment is low, the segment is on; when the cathode level of a certain segment is high, the segment is off. For the

LROBRUYA

common cathode display, connect the common cathode (COM) to GND.

When the anode level of a certain segment is high, the segment is on;

when the anode level of a certain segment is low, the segment is off.

Each segment of the display consists of an LED. So when you use it, you also need use a current-limiting resistor. Otherwise, LED will be burnt out. In this experiment, we use a common cathode display. As we mentioned above, for common cathode display, connect the common cathode (COM) to GND. When the anode level of a certain segment is high, the segment is on; when the anode level of a certain segment is low, the segment is off.

Hardware Required

1.LONTEN Uno R3 Board *1

2.USB Cable *1

3.1-digit Segment Display*1

4.220Ω Resistor *8

5.Breadboard*1

6.Breadboard Jumper Wires* Several

Circuit Connection

Sample Program

There are seven segments for numerical display, one for decimal point display. Corresponding segments will be turned on when displaying certain numbers. For example, when displaying number 1, b and c segments will be turned on. We compile a subprogram for each number, and compile the main program to display one number every 2 seconds, cycling display number 0 ~ 9. The displaying time for each number is subject to the delay time, the longer the delay time, the longer the displaying time.

////////////////////////////////////

```
// set the IO pin for each segment

int a=7;// set digital pin 7 for segment a

int b=6;// set digital pin 6 for segment b

int c=5;// set digital pin 5 for segment c

int d=10;// set digital pin 10 for segment d

int e=11;// set digital pin 11 for segment e

int f=8;// set digital pin 8 for segment f

int g=9;// set digital pin 9 for segment g

int dp=4;// set digital pin 4 for segment dp

void digital_0(void) // display number 0
{
    unsigned char j;

    digitalWrite(a,HIGH);

    digitalWrite(b,HIGH);

    digitalWrite(c,HIGH);

    digitalWrite(d,HIGH);

    digitalWrite(e,HIGH);

    digitalWrite(f,HIGH);

    digitalWrite(g,LOW);

    digitalWrite(dp,LOW);
```

```
}
```

```
void digital_1(void) // display number 1
```

```
{
```

```
    unsigned char j;
```

```
    digitalWrite(b,HIGH);// turn on segment b
```

```
    digitalWrite(c,HIGH);// turn on segment c
```

```
    for(j=7;j<=11;j++)// turn off other segments
```

```
        digitalWrite(j,LOW);
```

```
    digitalWrite(dp,LOW);// turn off segment dp
```

```
}
```

```
void digital_2(void) // display number 2
```

```
{
```

```
    unsigned char j;
```

```
    digitalWrite(b,HIGH);
```

```
    digitalWrite(a,HIGH);
```

```
    for(j=9;j<=11;j++)
```

```
        digitalWrite(j,HIGH);
```

```
    digitalWrite(dp,LOW);
```

```
    digitalWrite(c,LOW);
```

```
    digitalWrite(f,LOW);  
}  
  
void digital_3(void) // display number 3  
{  
    digitalWrite(g,HIGH);  
    digitalWrite(a,HIGH);  
    digitalWrite(b,HIGH);  
    digitalWrite(c,HIGH);  
    digitalWrite(d,HIGH);  
    digitalWrite(dp,LOW);  
    digitalWrite(f,LOW);  
    digitalWrite(e,LOW);  
}  
  
void digital_4(void) // display number 4  
{  
    digitalWrite(c,HIGH);  
    digitalWrite(b,HIGH);  
    digitalWrite(f,HIGH);  
    digitalWrite(g,HIGH);  
    digitalWrite(dp,LOW);
```

```
digitalWrite(a,LOW);

digitalWrite(e,LOW);

digitalWrite(d,LOW);
}

void digital_5(void) // display number 5
{
    digitalWrite(a,HIGH);
    digitalWrite(b, LOW);
    digitalWrite(c,HIGH);
    digitalWrite(d,HIGH);
    digitalWrite(e, LOW);
    digitalWrite(f,HIGH);
    digitalWrite(g,HIGH);
    digitalWrite(dp,LOW);
}

void digital_6(void) // display number 6
{
    unsigned char j;

    for(j=7;j<=11;j++)

        digitalWrite(j,HIGH);
```

```
digitalWrite(c,HIGH);

digitalWrite(dp,LOW);

digitalWrite(b,LOW);

}

void digital_7(void) // display number 7
{
    unsigned char j;
    for(j=5;j<=7;j++)
        digitalWrite(j,HIGH);
    digitalWrite(dp,LOW);
    for(j=8;j<=11;j++)
        digitalWrite(j,LOW);
}

void digital_8(void) // display number 8
{
    unsigned char j;
    for(j=5;j<=11;j++)
        digitalWrite(j,HIGH);
    digitalWrite(dp,LOW);
}
```

```
void digital_9(void) // display number 9
{
    digitalWrite(a,HIGH);
    digitalWrite(b,HIGH);
    digitalWrite(c,HIGH);
    digitalWrite(d,HIGH);
    digitalWrite(e, LOW);
    digitalWrite(f,HIGH);
    digitalWrite(g,HIGH);
    digitalWrite(dp,LOW);
}

void setup()
{
    int i;// set variable
    for(i=4;i<=11;i++)
        pinMode(i,OUTPUT);// set pin 4-11 as “output”
}

void loop()
{
    digital_0();// display number 0
```

```
delay(2000);// wait for 2s

digital_1();// display number 1

delay(2000);// wait for 2s

digital_2();// display number 2

delay(2000); // wait for 2s

digital_3();// display number 3

delay(2000); // wait for 2s

digital_4();// display number 4

delay(2000); // wait for 2s

digital_5();// display number 5

delay(2000); // wait for 2s

digital_6();// display number 6

delay(2000); // wait for 2s

digital_7();// display number 7

delay(2000); // wait for 2s

digital_8();// display number 8

delay(2000); // wait for 2s

digital_9();// display number 9

delay(2000); // wait for 2s

}
```

LROBRUYA

////////////////////////////////////

Result

LED segment display repeat displays number 0 to 9.
